

PASCO Structures System
Truss Set
ME-6990

<u>Included Equipment</u>	<u>Quantity</u>
1. #1 Beams	8
2. #2 Beams	8
3. #3 Beams	18
4. #4 Beams	18
5. #5 Beams	8
6. Brackets	14
7. Screws	75

Related Equipment

- Load Cell & Amplifier Set (PS-2199)
- Bridge Set (ME-6991)

See www.pasco.com for other PASCO Structures System parts and sets.

Introduction

The Truss Set includes beams, brackets, and screws for building various trusses and bridges.

The Truss Set can be combined with other parts of the PASCO Structures System. The Load Cell & Amplifier Set (PASCO part

PS-2199) can be added to measure compression and tension forces in the components of any PASCO Structure.

About the Components

Attach beams to brackets as illustrated.

Figure 1: Attaching a beam to a bracket

Each bracket has eight slots, labeled A through H, for accepting beams.

There are five sizes of beam, labeled #1 through #5.

Simple Triangles

Most structures are made of isosceles right triangles as shown in Figure 2 and Figure 3.

Figure 2: A triangle made from a #5 beam and two #4 beams

Figure 3: Combinations of beams to make triangles

Structures

Kingpost Truss

Figure 4 shows a simple kingpost truss made from #5 and #4 beams. Use a hanging mass to apply load.

Figure 4: A simple kingpost truss

Lay the kingpost truss flat on the table to compare its horizontal and vertical stiffness.

To build a three-dimensional structure, connect two trusses with #4 beams (Figure 5).

Figure 5: A three-dimensional kingpost truss structure

Add cross bracing to increase stiffness.

Figure 6: Kingpost truss with cross bracing

Queenpost Truss

To make a queenpost truss, separate the kingpost truss in the middle and add a square section.

Figure 7: Queenpost truss

Legs can be added to any truss or bridge.

Figure 8: Queenpost truss with legs

Roof Truss

Figure 9: Roof truss

Two-span Bridge

Remove the center section of a roof truss and replace it with a #5 beam.

Figure 10: Two-span Bridge

Bridge with Verticals

The bridge with verticals has additional deck support.

Figure 11: Subdivided bridge

Deck Truss

Make a deck truss by turning the bridge with verticals over. Use #5 beams for legs.

Figure 12: Deck truss

Properties of I-beams

This demonstration shows the difference between the X and Y bending moments of an I-beam.

Figure 13: Bending an I-beam

Adding Load Cells

To measure the compression and tension forces in individual members, add load cells (PASCO part PS-2199) to any PASCO Structure. Replace a beam with two shorter beams and a load cell.

#5 beam = load cell + two #3 beams

#4 beam = load cell + two #2 beams

#3 beam = load cell + two #1 beams

Figure 14: A load cell combined with two #2 beams is the same length as a #4 beam

Use thumbscrews to attach two beams to a load cell as shown in Figure 14.

When using load cells, assemble your structure with the screws loose. This will simplify the analysis by ensuring that the members experience only tension and compression without moments.

See the instructions that came with the load cells for details about how to connect the load cells to an interface or datalogger and collect data.

Example: Bridge with Load Cells

Figure 15: Bridge with load cells

The bridge shown in Figure 15 incorporates six load cells to measure the tension or compression in various members. A hanging mass is used to apply load. The mass is adjusted so that the compression in one of the legs is 1.0 N. Compression is registered as a positive value and tension as a negative value.

If the screws are loose, the theoretical analysis of the bridge can be carried out by assuming that the net force at each node is zero. Thus, the vertical component of compression in the left-most diagonal member must be 1 N (to oppose the force applied by the leg). The horizontal component must also be 1 N since the member is at a 45° angle. The predicted resultant force is:

$$\sqrt{(1.0 \text{ N})^2 + (1.0 \text{ N})^2} = 1.4 \text{ N}$$

The actual measured force confirms the theory.

Calibration of Load Cells

Load cells are factory calibrated; however, you can recalibrate them in software or on the datalogger. See the documentation for your software or datalogger for instructions.

When calibrating a load cell, it is necessary to apply a known load. Assemble the fixture shown in Figure 16 to support the load cell. Hold or clamp the fixture at the edge of a table and hang a mass from it as shown.

Note that the hanging mass applies tension to the load cell; therefore the known force that you enter into the software or datalogger should be a negative value. For example, if the mass is 1.0 kg, the applied force is -9.8 N.
